

The "Book Store Application" will be tested on the website we have provided below.

In order to develop the tests, it is expected that the scenarios of the following cases are created and the automation code is written in accordance with these scenarios.

Operations should be as follows:

- Login-logout
- Search book
- Add-Delete books
- Change row number on profile page

For each case, the scenarios should be created in such a way that the outputs are confirmed. For example; the user logs in, the login is confirmed. User logs out the logout confirmed etc.

It will be a priority for us to preferably use **Cypress** for the writing of automation scripts, but you can also use other tools-frameworks if you wish. In addition, **BDD** is another method we prefer to write tests in accordance with scenarios.

It is expected that the tests can run as a **cross-browser** and the test results will be **reported**.

The link to the website to be tested is as follows (<https://demoqa.com/books>)
